Assignment 4: Data Wrangling (Fall 2024)

Emily Yang

OVERVIEW

This exercise accompanies the lessons in Environmental Data Analytics on Data Wrangling

Directions

- 1. Rename this file <FirstLast>_A04_DataWrangling.Rmd (replacing <FirstLast> with your first and last name).
- 2. Change "Student Name" on line 3 (above) with your name.
- 3. Work through the steps, **creating code and output** that fulfill each instruction.
- 4. Be sure to **answer the questions** in this assignment document.
- 5. When you have completed the assignment, **Knit** the text and code into a single PDF file.
- 6. Ensure that code in code chunks does not extend off the page in the PDF.

Set up your session

- 1a. Load the tidyverse, lubridate, and here packages into your session.
- 1b. Check your working directory.
- 1c. Read in all four raw data files associated with the EPA Air dataset, being sure to set string columns to be read in a factors. See the README file for the EPA air datasets for more information (especially if you have not worked with air quality data previously).
 - 2. Add the appropriate code to reveal the dimensions of the four datasets.

```
#1a
library(tidyverse)
library(lubridate)
library(here)
library(dplyr)
library(tidyr)
#1b
getwd()
```

[1] "/home/guest/EDE_Fall2024"

```
#1c read in data
EPA.air.03.2018 <- read.csv(
   file = here ("Data/Raw/EPAair_03_NC2018_raw.csv"), stringsAsFactors = T)</pre>
```

```
EPA.air.03.2019 <- read.csv(</pre>
  file = here ("Data/Raw/EPAair_03_NC2019_raw.csv"), stringsAsFactors = T)
EPA.air.PM25.2018 <- read.csv(</pre>
  file = here ("Data/Raw/EPAair_PM25_NC2018_raw.csv"), stringsAsFactors = T)
EPA.air.PM25.2019 <- read.csv(</pre>
  file = here ("Data/Raw/EPAair_PM25_NC2019_raw.csv"), stringsAsFactors = T)
#2 dimensions for each dataset
dim(EPA.air.03.2018)
## [1] 9737
              20
dim(EPA.air.03.2019)
## [1] 10592
                 20
dim(EPA.air.PM25.2018)
## [1] 8983
              20
dim(EPA.air.PM25.2019)
## [1] 8581
              20
```

All four datasets should have the same number of columns but unique record counts (rows). Do your datasets follow this pattern? Yes, my four datasets have different number of observations but all of them have 20 variables.

Wrangle individual datasets to create processed files.

- 3. Change the Date columns to be date objects.
- 4. Select the following columns: Date, DAILY_AQI_VALUE, Site.Name, AQS_PARAMETER_DESC, COUNTY, SITE_LATITUDE, SITE_LONGITUDE
- 5. For the PM2.5 datasets, fill all cells in AQS_PARAMETER_DESC with "PM2.5" (all cells in this column should be identical).
- 6. Save all four processed datasets in the Processed folder. Use the same file names as the raw files but replace "raw" with "processed".

```
SITE_LONGITUDE)
EPA.air.03.2019_selected <-
  EPA.air.03.2019 %>% select(Date, DAILY_AQI_VALUE, Site.Name,
                             AQS_PARAMETER_DESC, COUNTY, SITE_LATITUDE,
                             SITE LONGITUDE)
EPA.air.PM25.2018 selected <-
  EPA.air.PM25.2018 %>% select(Date, DAILY_AQI_VALUE, Site.Name,
                               AQS PARAMETER DESC, COUNTY, SITE LATITUDE,
                               SITE LONGITUDE)
EPA.air.PM25.2019 selected <-
  EPA.air.PM25.2019 %>% select(Date, DAILY_AQI_VALUE, Site.Name,
                               AQS_PARAMETER_DESC, COUNTY, SITE_LATITUDE,
                               SITE_LONGITUDE)
#5
EPA.air.PM25.2018_selected <- EPA.air.PM25.2018_selected %>%
  mutate(AQS_PARAMETER_DESC = "PM2.5") #fill all cells in AQS_PARAMETER_DESC with "PM2.5"
EPA.air.PM25.2019_selected <- EPA.air.PM25.2019_selected %>%
  mutate(AQS PARAMETER DESC = "PM2.5")
#6 Save processed datasets
write.csv(EPA.air.03.2018_selected, row.names = FALSE,
          file ="./Data/Processed/EPAair_03_NC2018_processed.csv")
write.csv(EPA.air.03.2019_selected, row.names = FALSE,
          file ="./Data/Processed/EPAair_03_NC2019_processed.csv")
write.csv(EPA.air.PM25.2018_selected, row.names = FALSE,
          file ="./Data/Processed/EPAair_PM25_NC2018_processed.csv")
write.csv(EPA.air.PM25.2019_selected, row.names = FALSE,
          file ="./Data/Processed/EPAair_PM25_NC2019_processed.csv")
```

Combine datasets

- 7. Combine the four datasets with rbind. Make sure your column names are identical prior to running this code.
- 8. Wrangle your new dataset with a pipe function (%>%) so that it fills the following conditions:
- Include only sites that the four data frames have in common:

```
"Linville Falls", "Durham Armory", "Leggett", "Hattie Avenue", "Clemmons Middle", "Mendenhall School", "Frying Pan Mountain", "West Johnston Co.", "Garinger High School", "Castle Hayne", "Pitt Agri. Center", "Bryson City", "Millbrook School"
```

(the function intersect can figure out common factor levels - but it will include sites with missing site information, which you don't want...)

• Some sites have multiple measurements per day. Use the split-apply-combine strategy to generate daily means: group by date, site name, AQS parameter, and county. Take the mean of the AQI value, latitude, and longitude.

- Add columns for "Month" and "Year" by parsing your "Date" column (hint: lubridate package)
- Hint: the dimensions of this dataset should be $14,752 \times 9$.
- 9. Spread your datasets such that AQI values for ozone and PM2.5 are in separate columns. Each location on a specific date should now occupy only one row.
- 10. Call up the dimensions of your new tidy dataset.

```
11. Save your processed dataset with the following file name: "EPAair O3 PM25 NC1819 Processed.csv"
#7 combine all 4 datasets
EPA.air.03.PM25.2018.2019 <- rbind(EPA.air.03.2018_selected, EPA.air.03.2019_selected, EPA.air.PM25.201
dim(EPA.air.03.PM25.2018.2019)
## [1] 37893
EPA.air.03.PM25.2018.2019 <- EPA.air.03.PM25.2018.2019 %>%
  filter(Site.Name %in% c("Linville Falls", "Durham Armory", "Leggett",
                          "Hattie Avenue", "Clemmons Middle",
                          "Mendenhall School", "Frying Pan Mountain",
                          "West Johnston Co.", "Garinger High School",
                          "Castle Hayne", "Pitt Agri. Center", "Bryson City",
                          "Millbrook School")) %>% # include the sites in common
  group_by(Date, Site.Name, AQS_PARAMETER_DESC, COUNTY) %>% # grouping
  summarise(
   meanAQI = mean(DAILY_AQI_VALUE), # mean of AQI, Latitude and Longitude
   meanLatitude = mean(SITE_LATITUDE),
   meanLongitude = mean(SITE_LONGITUDE)) %>%
  mutate(Month = month(Date), Year = year(Date))
## 'summarise()' has grouped output by 'Date', 'Site.Name', 'AQS_PARAMETER_DESC'.
## You can override using the '.groups' argument.
#dim(EPA.air.03.PM25.2018.2019)
#9 Spread the dataset
EPA.air.03.PM25.2018.2019 <- EPA.air.03.PM25.2018.2019 %>%
  pivot_wider(names_from = AQS_PARAMETER_DESC,
              values_from = meanAQI)
#10 dimensions of the new dataset
dim(EPA.air.03.PM25.2018.2019)
## [1] 8976
#11 save the dataset
write.csv(EPA.air.03.PM25.2018.2019, row.names = FALSE,
          file ="./Data/Processed/EPAair_03_PM25_NC1819_Processed.csv")
```

Generate summary tables

- 12. Use the split-apply-combine strategy to generate a summary data frame. Data should be grouped by site, month, and year. Generate the mean AQI values for ozone and PM2.5 for each group. Then, add a pipe to remove instances where mean **ozone** values are not available (use the function drop_na in your pipe). It's ok to have missing mean PM2.5 values in this result.
- 13. Call up the dimensions of the summary dataset.

```
#12 summary dataframe
summary.EPA.air.O3.PM25.2018.2019 <- EPA.air.O3.PM25.2018.2019 %>%
group_by(Site.Name, Month, Year) %>%
summarise(
   meanAQI.O3 = mean(Ozone),
   meanAQI.PM25 = mean(PM2.5)
) %>%
drop_na(meanAQI.O3)
```

'summarise()' has grouped output by 'Site.Name', 'Month'. You can override
using the '.groups' argument.

```
#13 dimensions of the summary dataframe
dim(summary.EPA.air.03.PM25.2018.2019)
```

```
## [1] 182 5
```

14. Why did we use the function drop_na rather than na.omit? Hint: replace drop_na with na.omit in part 12 and observe what happens with the dimensions of the summary date frame.

Answer: na.omit removes all rows in any column with an NA value. drop_na allows me to specify the column I plan to drop NA values from. As a result, na.omit reduced a great number of rows than drop_na.
